

LUXSYNC

WHERE LUXURY LIVES INTELLIGENTLY

THE ROI OF SMART LIVING

NURSING HOMES

A LUXSYNC GUIDE
SMARTER LIVING. MEASURABLE VALUE.

Nursing Homes

For nursing-home owners, administrators, facilities leaders, operations teams, and care-technology stakeholders

In a nursing-home environment, technology must support dignity, comfort, staff workflow, and responsible property operations. The ROI case should be grounded in measured operational improvement-not medical promises or assumptions that automation can replace people, clinical systems, or required safety infrastructure.

The Nursing-Home ROI Case

Value area	What to measure	Relevant LuxSync capabilities
Staff workflow	Time spent on non-clinical environmental adjustments and repeatable room tasks	Accessible Living, lighting, climate, routines
Resident comfort	Environmental requests, room-comfort feedback, response time	Climate Intelligence, Gentle Morning, Goodnight, accessible controls
Nighttime environment	Lighting-related requests and pathway-lighting usability	Night Path, low-level lighting routines
Room readiness	Time and steps required to prepare rooms after a transition	Room-state routines, lighting, climate, Property Pulse
Energy operations	Lighting and climate use in rooms and common areas	Energy Intelligence, Climate Intelligence, Away states for appropriate spaces
Water/property awareness	Leak detection and facilities response	Water Watch, compatible sensors and shut-off capabilities
Facilities oversight	Manual checks, site walks, and exception response	Property Pulse, environmental and device-status visibility

Build the Baseline

Before a pilot, document:

- room count, common areas, floors, and operating zones;
- utility use by available meter or zone;
- non-clinical environmental requests and response times;
- staff time spent on repeatable room/environment tasks;
- room turnover or readiness time;
- water events and facilities response history;
- resident, family, staff, privacy, accessibility, consent, and regulatory requirements;
- existing nurse-call, fire/life-safety, security, building-management, and clinical systems that must remain independent unless an approved integration is specifically validated.

Nursing-Home ROI Worksheet

Input	Your value / unit	Reference method
Annual verified energy savings	_____ \$	Normalized baseline minus measured post-launch cost
Annual non-clinical staff time recovered	_____ \$	Verified hours avoided × loaded labor cost
Annual room-readiness value	_____ \$	Verified time reduction × labor cost; add attributable capacity value only when evidenced
Annual facilities response value	_____ \$	Avoided routine checks/trips × loaded cost
Risk-adjusted water/property value	_____ \$	Probability × attributable avoidable cost; report as a scenario
Annual recurring cost	_____ \$	Subtract from benefits
Initial investment	_____ \$	Validated equipment, setup, training, and change-management cost

Pilot With Governance First

Select a limited non-clinical use case and involve administration, facilities, IT/security, accessibility, privacy, care leadership, residents or representatives, and legal/compliance reviewers as appropriate. Define what the system may control, who receives alerts, what happens during connectivity loss, and how consent and access are handled.

Good pilot candidates may include:

- common-area lighting schedules;
- resident-controlled room lighting or climate where appropriate;
- Night Path lighting that does not interfere with care protocols;
- leak awareness in a limited zone;
- non-clinical room-readiness routines.

What a LuxSync Nursing-Home Blueprint Can Include

- property and technology profile;
- stakeholder, privacy, accessibility, and compatibility review flags;
- non-clinical Experience recommendations;
- pilot boundaries and human-override requirements;
- phased implementation path;
- baseline, measurement owner, and review cadence.

Care and Safety Boundary

LuxSync solutions are not medical devices, nurse-call systems, fall-detection guarantees, clinical monitoring, emergency response, professional security monitoring, or substitutes for required staffing and life-safety systems. No automation should delay or replace clinical judgment, resident support, emergency procedures, or mandated equipment.

Your measurement log

Record observations before and after a change. Use comparable periods, consistent units, and your own measured data. Keep estimates and scenario values clearly labeled.

Property / project: _____

Period: _____ Recorded by: _____

Phase: Baseline / Pilot / Follow-up

Record your observations

Value area	Measurement / unit	Notes / evidence
Staff workflow	_____ _____	_____ _____
Resident comfort	_____ _____	_____ _____
Nighttime environment	_____ _____	_____ _____
Room readiness	_____ _____	_____ _____
Energy operations	_____ _____	_____ _____
Water/property awareness	_____ _____	_____ _____
Facilities oversight	_____ _____	_____ _____

Context: occupancy, weather, schedule, or equipment changes

Compare two periods

Copy recorded values side by side. This worksheet makes no automatic ROI, savings, or payback calculation. Explain differences in context before drawing conclusions.

Period A: _____ Period B: _____

Value area	Period A / unit	Period B / unit
Staff workflow	_____	_____
Resident comfort	_____	_____
Nighttime environment	_____	_____
Room readiness	_____	_____
Energy operations	_____	_____
Water/property awareness	_____	_____
Facilities oversight	_____	_____

What changed? What needs another measurement?
